CHRONIQUES DES ÂGES FAROUCHES

FLUIDE GLACIAL

of the test, the subject was asked to indicate the perceived loudness of the sound on a scale from 1 (very quiet) to 10 (very loud).

The test was repeated 10 times for each of the 10 subjects. The order of the test conditions was randomized. The test results were used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are shown in Figure 1. The perceived loudness of the sound increases with the measured sound pressure level.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.

The test results are used to determine the relationship between the measured sound pressure level and the perceived loudness of the sound.
